***Allowable Subject Matter***

1. Claims 18-24 are allowed.
2. The following is an examiner's statement of reasons for allowance:
3. The prior arts of record do not anticipate or render obvious to one skilled in the art a reflective active matrix liquid crystal display device comprising various elements as claimed, more specifically the switching elements being spatially separated from, positioned subjacent and electrically connected to the plurality of electrodes, wherein the space separating the switching elements and the pixel electrodes is filled with an electrically insulating color selection layer which selectively reflects light of particular wavelengths and renders the switching elements invisible to the reflected light is considered novel.
4. The closest reference USPAT 6,671,016 (commonly assigned) discloses a transflective type liquid crystal display device that includes a cholesteric color filter. However, Kim fails to teach or suggest with any other prior art references the limitations such as wherein the space separating the switching elements and the pixel electrodes is filled with an electrically insulating color selection layer which selectively reflects light of particular wavelengths and renders the switching elements invisible to the reflected light. Further, the newly cited reference JP 06-186544 discloses a reflective liquid crystal display wherein a cholesteric color filter is formed above the pixel electrode, which is different than the instant claims. The JP reference is also silent about the limitations such as the color insulation layer selectively reflects light of particular wavelengths and renders the switching elements invisible to the reflected light.
